

Business Card Creation and Customization

Objective

Design a digital business card for a company that allows users to customize and personalize their card based on their preferences. The tool should enable users to either create a card from scratch or utilize predefined templates, while offering options to input essential company details and apply theme settings.

Instructions

1. Card Template Selection:

- Users must be given two options for creating their business card:
 - **Clean Card:** This option allows users to manually design the card, giving them full control over each element.
 - **Standard Card:** This option uses a pre-designed template where users can replace the content (such as company name, contact details, etc.) and modify colors as needed.

2. User Personalization Options:

- Provide input fields for users to add the following details:
 - Company Name*
 - Logo* (with an option to upload or select a reference)
 - Website URL*
 - Full Name*
 - Designation*
 - Contact Number*
 - Email Address*
- Enable users to preview changes in real-time on both the **front** and **back** of the card.

3. Theme Customization:

- Allow users to modify the theme of the card, including background colors, fonts, and text alignment.
- Implement a reset button to allow users to reset theme changes and start over if needed.

4. QR Code Integration:

- Generate a QR code that redirects to the company's website.
- This QR code must be visible on the card (e.g., on the back) for easy access.

5. Preview and Download Options:

- Provide users with a live preview of the business card as they make changes.
- Include functionality to download the final card in an appropriate format (PNG, PDF).

6. Reset Functionality:

- Implement a reset button to allow users to clear all changes and start over if needed.
