

Dynamic Menu Bar Creation

Objective

Create a dynamic and interactive menu bar system. You can only work with JavaScript to manipulate DOM elements, handle events, and update the UI dynamically based on user inputs. The menu bar should allow users to create, edit, and delete hierarchical menu structures.

Instructions:

1. Dynamic Node Creation:

- Add parent nodes (e.g., Node 1, Node 2, etc.).
- Add child nodes under specific parent nodes.

2. Editing Nodes:

- Implement functionality to edit the name of any node in the hierarchy.

3. Deleting Nodes:

- Allow users to delete any node, whether it's a parent or a child. Ensure that deleting a parent also removes all its children.

4. Hierarchical Display:

- Display the nodes hierarchically, with proper nesting for child and sub-child nodes.

5. Dropdown Management:

- Use dropdown menus to select a parent or child node for adding new nodes.

6. Interactive Buttons:

- Include **Add**, **Edit**, and **Delete** buttons for each node and ensure they work as expected.

7. Input Handling:

- Use a text input field to allow users to name or rename nodes.

8. Styling:

- Maintain a clean and visually consistent interface similar to the provided image.

9. Validation:

- Ensure user input is validated (e.g., prevent adding blank node names).
